

1 ABSTRACT OF THE INVENTION

2 A support bracket designed to be removably attached to a vertical  
3 member, such as a building stud, can support a variety of objects. In one  
4 embodiment, and when used in pairs, the support brackets form a system to hold  
5 objects such as a spool of electrical wire rollably mounted on a rod or to support a  
6 work surface. In another embodiment, and when used in vertically opposed and  
7 spaced pairs, the support brackets form a system to hold objects such as a coil of  
8 plastic plumbing line.
